

# COVID-19 RESPONSE FUNDING UPDATE

June 19-25, 2020

## FACTS

---

\$111,233,263

Funds Mobilized

---

801 Grants Funded

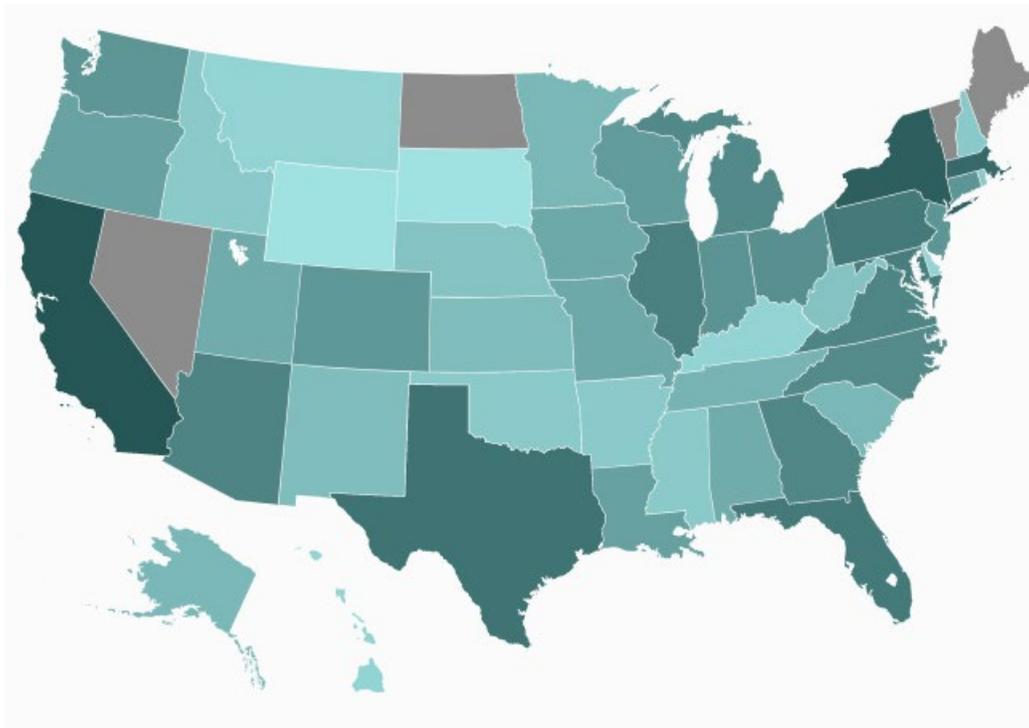

---

# OVERVIEW

In response to the COVID-19 virus, the National Science Foundation (NSF) is mobilizing funding from the FY2020 budget and supplemental appropriations through the Coronavirus Aid, Relief, and Economic Security (CARES) Act. CARES Act funding supports a wide range of research areas to help the country fight and recover from the COVID-19 crisis through several research funding mechanisms, including Rapid Response Research (RAPID), a fast-tracked grant process to accelerate critical discoveries.

## AWARDS

COVID-19 related awards by state, shade of blue correlates to number of awards.

	CARES Act	All COVID-19
<b>Number of Awards</b>	504	801
<b>Funding Deployed</b>	\$72,693,798	\$111,233,263

This update spotlights several recent awards, just a snapshot of the essential work NSF is funding through the CARES Act and FY2020 appropriations. You can explore all of the COVID-19 related research grants awarded through the National Science Foundation at [this link](#).

## DIVISION OF COMPUTER AND NETWORK SYSTEMS

### CARES ACT \$100,000

<b>Title</b>	RAPID: Algorithms and Heuristics for Remote Food Delivery under Social Distancing Constraints
<b>Institution</b>	Carnegie Mellon University; Pittsburgh, PA
<b>What</b>	This goal of this project is to optimize processes for remote meal delivery to vulnerable populations of low-income students and seniors who generally receive food at schools, shelters, and food banks. New algorithms and heuristics will address unique challenges of geographically dispersed food delivery within new social distancing constraints.
<b>Why</b>	Public health and social distancing constraints demand new optimization solutions for remote food delivery. This research will offer insight and, through existing relationships with the Allegheny County Department of Human Services, Southwestern Pennsylvania United Way, and Allies for Children and the Greater Pittsburgh Food Bank, the project will apply research results to inform ongoing pilot food delivery efforts.

## DIVISION OF INTEGRATIVE ORGANISMAL SYSTEMS

### CARES Act \$199,699

<b>Title</b>	RAPID: Aerosol and Direct Transmission of SARS-CoV-2 in Bats and other Animals
<b>Institution</b>	University of Utah; Salt Lake City, UT
<b>What</b>	This research will lead to a better understanding of how and why SARS-CoV-2 transmission occurs through direct routes in species like bats but may occur through airborne routes in species like hamsters, deer mice, and humans.
<b>Why</b>	Transmission to and among different host species could allow the SARS-CoV-2 virus to evolve and become more virulent, create new viral reservoirs, or increase the spread of disease with major economic and ecological ramifications. Understanding the mechanisms that allow transmission in different hosts is critical to mitigating these effects.

## DIVISION OF CHEMICAL, BIOENGINEERING, ENVIRONMENTAL, AND TRANSPORT SYSTEMS

### FY2020 \$199,994

<b>Title</b>	RAPID: Understanding SARS-CoV2 transmission through a novel continuous monitoring system
<b>Institution</b>	Tulane University; New Orleans, LA
<b>What</b>	This project will investigate transmission through direct and indirect contact using a novel non-invasive monitoring system. The system will continuously capture data such as body temperature, head-body distance, activity patterns and breathing sounds. Algorithms will identify meaningful disease patterns in the data to help stage progression of COVID-19.
<b>Why</b>	Critical knowledge about transmission of the virus that causes COVID-19—for example, how soon an infected individual can transmit the virus to another person via direct or indirect contact—remains unknown. The data obtained from this research will help identify such meaningful patterns.

## DIVISION OF INFORMATION AND INTELLIGENT SYSTEMS

### CARES ACT \$199,736

<b>Title</b>	RAPID: Learning from the Experiences of COVID-19 Survivors
<b>Institution</b>	Dartmouth College; Hanover, NH
<b>What</b>	Researchers are building data collection platforms to gather information from a broad population of people, including a focus on African-Americans, affected by COVID-19. They are also developing computational and analytical tools that will be able to draw important and novel insights about the impacts of COVID-19 on survivors' lives.
<b>Why</b>	This approach helps maximize what we know about COVID-19 and how it affects diverse people and communities by focusing on wide-scale data collection and finding new ways to draw conclusions from that data that can inform people and public health decisions.

## DIVISION OF MOLECULAR AND CELLULAR BIOSCIENCES

### CARES Act \$199,842

<b>Title</b>	Collaborative Research: RAPID: Molecular underpinnings that define volatile compound signature of the lung
<b>Institutions</b>	Rush-Presbyterian-St. Luke's Medical Center; Chicago, IL Illinois Institute of Technology; Chicago, IL
<b>What</b>	This project seeks to determine the cause of and, using analytical devices, measure the molecular composition of volatile organic compounds (VOCs) released by infected bronchial epithelial cells in individuals with COVID-19.
<b>Why</b>	Fundamental knowledge of the biological mechanisms that generate VOC signals in viral infected lung cells and engineering tools and instrumentation that can capture and analyze the VOCs could provide guidance for design of rapid, non-invasive, point-of-care tests that can detect SARS-CoV-2 infection in the US population.

## DIVISION OF CHEMISTRY

### FY2020 \$200,000

<b>Title</b>	RAPID: Collaborative Research: Mathematical tools for analysis of genomic diversity of SARS-CoV-2 virus in the context of its co-evolution with host populations
<b>Institutions</b>	Pennsylvania State University- University Park; State College, PA University of North Carolina Greensboro; Greensboro, NC
<b>What</b>	Researchers are exploring a new, more accurate, and inexpensive method for rapidly detecting small amounts of virus that works by attaching nanoparticles to the outside of the virus that then enable detection by a novel 3-D printed sensor.
<b>Why</b>	Testing continues to be an important tool for understanding, tracking, and controlling the spread of COVID-19. Research like this can help improve testing capacity by increasing efficiency and reducing cost.
