

New Nanoprobe Network Website Launches

The Nanoprobe Network (<http://nanoprobenetwork.org>) is a electronic platform for international community building around technical issues related to probes at the nanometer scale. It is a free, user-driven website for collaboration, communication, and information exchange on all research relating to the local probing of phenomena at the nanoscale. This is a focal point for resources which include featured blogs, user discussions, shared software, and Probe-Pedia - the new on-line encyclopedia for scanning probes.

You are invited to log in and participate: voice your opinions on scientific advances, exchange hints and advice in the Forums, comment on blogs, list news and events of interest to the community, write or edit an article in Probe-Pedia, and contribute or download images, audio, video, software, and presentations. Live events include topical panels and featured discussions.

To promote this new resource, prizes for new users and content contributed to the site will be awarded. Visit <http://nanoprobenetwork.org> today to join and participate.
