## Acknowledgments

This report was prepared by Kelly H. Kang at the National Center for Science and Engineering Statistics (NCSES) with Caren A. Arbeit, Peter Einaudi, and Patricia Green at RTI International. The analysis of data for this publication was conducted by RTI International on behalf of NCSES under contract number NSFDACS1063289.

Catherine Corlies and Tanya Gore of the NCSES Information and Technology Services Program (ITSP) provided editorial assistance and final composition for this report. Rajinder Raut of ITSP developed the Web version of the report with technical assistance from staff of Penobscot Bay Media.

Jock Black, Michael Gibbons, and Audrey Kindlon at NCSES served as internal reviewers and provided many helpful comments. Program Director Emilda Rivers and Division Director John Gawalt guided the content and presentation of this report.

## EXECUTIVE SUMMARY

This special report examines the impact of changes in the frame of institutions for the Survey of Graduate Students and Postdoctorates in Science and Engineering (GSS) based on frame evaluation research conducted during the past several survey cycles.

The GSS is an annual census of all academic institutions granting research-based master's degrees or doctorates in science, engineering, and selected health (SEH) fields in the United States. In 2010, the National Center for Science and Engineering Statistics (NCSES) at the National Science Foundation (NSF) initiated a comprehensive frame evaluation study for the GSS for the first time since 1979. This study sought to identify and survey any potentially eligible but not previously surveyed institutions.[1] The study initially identified 605 potentially eligible institutions, which were contacted for the GSS Eligibility Screening Survey in 2011.

The 2011 Eligibility Screening Survey identified 165 newly eligible institutions with at least one master's- or doctorate-granting program in science, engineering, or health. After collecting and assessing the quality of the data from the newly eligible institutions, NCSES decided more time was needed to thoroughly verify the degree program eligibility and to improve the data reporting quality from these institutions before including them in the GSS data. Over the next two cycles, 25 of these institutions were determined to be ineligible, leaving 140 eligible institutions at the end of the 2013 GSS cycle.

This analysis examines the impact of expanding the GSS frame to include these 140 new institutions on key GSS counts and trends.[2] In particular, this analysis looks at institutional characteristics and characteristics of graduate students, postdoctoral appointees (postdocs), and other doctorate-holding nonfaculty researchers (NFRs).

In general, this analysis shows that adding these new institutions will have limited impact on overall counts and trends in the GSS. Key findings include:

- The frame expansion is expected to increase SEH graduate enrollment reported in the GSS by approximately $3 \%$.
- Percentage point changes in the distribution of graduate students across most key dimensions collected by the GSS typically should be less than half of a percentage point.
- The impact on postdoc and NFR trends will be smaller than those related to graduate student counts because relatively few postdocs and NFRs are employed by the new institutions.
- New institutions have fewer GSS-eligible SEH units (academic departments, programs, research centers, or health care facilities) than previously eligible institutions.
- Compared with previously eligible institutions, new institutions have larger proportions of computer science and psychology units and fewer in engineering and health.
- Larger proportions of graduate students in new institutions are self-supported, enrolled part time, and are women, minorities, and U.S. citizens or permanent residents than in previously eligible GSS institutions.

## INTRODUCTION

The Survey of Graduate Students and Postdoctorates in Science and Engineering (GSS) is an annual census of all U.S. academic institutions granting research-based master's degrees or doctorates in science, engineering, and selected health (SEH) fields. The survey, sponsored by the National Center for Science and Engineering Statistics (NCSES) at the National Science Foundation (NSF) and by the National Institutes of Health, collects the total number of graduate students, postdoctoral appointees (postdocs), and doctorate-level nonfaculty researchers (NFRs) by demographic characteristics, fields of discipline, and sources of financial support. Results are used to assess shifts in graduate enrollment and postdoc appointments, as well as trends in financial support.

In 2010 NCSES conducted a comprehensive frame evaluation for the GSS. The study found 605 potentially eligible postsecondary academic institutions in the United States that were not previously surveyed in the GSS. NCSES in 2011conducted an eligibility screening survey of these institutions and identified 165 offering at least one master's- or doctorate-granting program in SEH. (See appendix A for more information).

After assessing the 2011 data reported by the newly identified institutions, NCSES decided more years of data were needed to verify the degree program eligibility and to work with the new institutions to improve their data reporting. Over the 2012 and 2013 survey cycles, 25 of the 165 newly identified institutions were confirmed as ineligible for the GSS and 140 confirmed as eligible.[3] The data from these institutions will be incorporated into the published GSS data beginning with the 2014 data release. In this special report, these 140 institutions are referred to as the new frame institutions, while the previously eligible institutions are designated as core institutions.

The eligibility of core institutions was also reviewed as part of this frame or coverage evaluation, and two for-profit core institutions offering mostly practitioner-oriented graduate degrees were determined to be ineligible.[4]

The analyses in this special report are primarily based on the 2013 GSS data, though several analyses use trend data from 1972 to 2013 to show the estimated impact of the survey frame changes on longerterm trends. This report begins with an examination of the differences in institutional and graduate student characteristics by new frame and core institution status, with a focus on the percentage point change in the estimates resulting from the inclusion of the new frame institutions. Additional analyses focus on the clustering of new frame institution students within a few disciplines and how total estimates of graduate students, postdocs, and NFRs will change when new frame institution data are included in the 2014 GSS and beyond. Field-level and demographic differences between graduate students enrolled in eligible SEH units (academic departments, programs, research centers, or health care facilities) at new frame and core institutions are also examined. This is followed by an analysis concerning the removal of the two for-profit institutions from the frame. The final section highlights the overall changes and new composition of the GSS data.

## Impact of Including the New Frame Institutions on GSS Trends

In 2013, the new frame institutions enrolled 20,772 SEH graduate students, representing 3.3\% of the 653,782 SEH graduate students in the United States in the core and new frame institutions (table 1). Incorporating the new frame institutions in the 2013 GSS results in marginal increases in the overall counts, and the new trend lines roughly parallel the old trend lines (figures 1 and 2).

TABLE 1. Changes in the estimates of graduate student characteristics, postdocs, and NFRs due to adding new frame institutions: 2013

| Characteristics | Count |  |  |  | Percent distribution |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | New frame institutions | Core institutions | All institutions | Percent change | New frame institutions | Core institutions | $\begin{array}{r} \text { All } \\ \text { institutions } \end{array}$ | Percentage point changea |
| All graduate students | 20,772 | 633,010 | 653,782 | 3.3 | 100.0 | 100.0 | 100.0 | - |
| Full-time | 9,529 | 468,953 | 478,482 | 2.0 | 45.9 | 74.1 | 73.2 | -0.9 |
| Part-time | 11,243 | 164,057 | 175,300 | 6.9 | 54.1 | 25.9 | 26.8 | 0.9 |
| Female | 11,174 | 291,380 | 302,554 | 3.8 | 53.8 | 46.0 | 46.3 | 0.2 |
| Male | 9,598 | 341,630 | 351,228 | 2.8 | 46.2 | 54.0 | 53.7 | -0.2 |
| Total postdocs | 1,048 | 61,942 | 62,990 | 1.7 | 100.0 | 100.0 | 100.0 | - |
| Total NFRs | 343 | 22,465 | 22,808 | 1.5 | 100.0 | 100.0 | 100.0 | - |

- = no value possible.

NFR = other doctorate-holding nonfaculty researcher; Postdoc = Postdoctoral appointees.
a Percentage point (PP) change is the percent distribution of all institutions minus the percent distribution of core institutions. The PP change (rather than the percent change) describes the impact of adding the new frame institutions on the current distribution.

The new frame institutions would add 11,243 part-time graduate students and 9,529 full-time graduate students to the 2013 GSS data (table 1). Including these students increases the total number of part-time students by $6.9 \%$ and the total number of full-time students by $2.0 \%$. Including the new frame institutions in the 2013 GSS data results in a 0.9 percentage point increase in the proportion of all graduate students enrolled part time.[5] It also adds $3.8 \%$ more women and $2.8 \%$ men to the SEH graduate student population over the 2013 data. As with the part- and full-time graduate students, the changes in the trend lines for women and men as a result of adding the new frame institutions to the 2013 GSS data are noticeable but relatively small (figures 1 and 2).

The new frame institutions employ relatively few postdocs and NFRs. Thus the inclusion of new frame institutions in the 2013 GSS data would have almost no change on the trend lines for these categories (figure 3). In 2013, there were 1,048 postdocs in new frame institutions, adding only $1.7 \%$ more postdocs over the 61,942 in the core institutions (table 1). NFRs in new frame institutions account for $1.5 \%$ of the total 22,808 NFRs reported in 2013. Because the new frame institutions will not have much impact on the GSS postdoc or NFR data, this report focuses mainly on graduate students.

Finally, though the overall impacts are fairly small, core and new frame institutions have some notable differences in their characteristics, as do their respective graduate students, postdocs, and NFRs (figure 4). These distinctions are detailed in the sections that follow.

## Comparing Core and New Frame Institutions

Key differences between core and new frame institutions include institutional control, Carnegie Classification, the number and type of GSS-eligible graduate degree programs offered, and the number of graduate students in those programs. The first step in determining the differences between the new frame and core institutions is to look at institutional characteristics and types of units, shown in table 2.

TABLE 2. Changes in the GSS institution and organizational unit characteristics due to adding newly eligible institutions in the survey frame: 2013

| Characteristics | Count |  |  |  | Percent distribution |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | New frame institutions | Core institutions | $\begin{array}{r} \text { All } \\ \text { institutions } \end{array}$ | Percent change | New frame institutions | institutions | $\begin{array}{r} \text { All } \\ \text { institutions } \end{array}$ | Percentage point change ${ }^{a}$ |
| All institutions | 140 | 563 | 703 | 24.9 | 100.0 | 100.0 | 100.0 | - |
| Institutional control |  |  |  |  |  |  |  |  |
| Public | 54 | 359 | 413 | 15.0 | 38.6 | 63.8 | 58.7 | -5.0 |

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.

As of 2013, there were 140 new frame institutions, compared to 563 core institutions.[6] Of the new frame institutions, $61.4 \%$ were private nonprofit, compared to $38.6 \%$ of core institutions. The new frame institutions will lead to a 5.1 percentage point increase in the overall percentage of private nonprofit institutions in the GSS. Whereas $36.2 \%$ of core institutions are doctoral research universities, there are no new frame institutions in this category. A majority (63.6\%) of new frame institutions are classified as master's-granting colleges and universities, compared to $40.3 \%$ of core institutions.

The mean number of eligible units per institution and the type of units reported by institution also vary substantially between core and new frame institutions. New frame institutions typically have only a few eligible SEH units, and only 1 in 10 units in new frame institutions reports having postdocs or NFRs (table 2). In 2013, the average core institution contained 23.7 eligible units, whereas the average new frame institution contained 3.0 eligible units. Almost all (93.6\%) units in new frame institutions enrolled graduate students, but only $9.9 \%$ employed postdocs and $8.0 \%$ employed NFRs. In comparison, 80.3\% of core institutions in 2013 reported graduate students, $44.2 \%$ employed postdocs, and $28.0 \%$ employed NFRs. These differences indicate that including the new frame institutions in GSS will improve the coverage of smaller research programs and diversify the survey universe.

The types of units found in new frame and core institutions also differ by field. New frame institutions have more units than core institutions in computer sciences ( $11.3 \%$ versus $4.0 \%$ ) and psychology ( $11.3 \%$ versus $6.2 \%$ ). The opposite is true for engineering ( $6.4 \%$ versus $14.7 \%$ ) and health ( $12.0 \%$ versus 19.1\%).

## Graduate Student Enrollment in Graduate Degree Fields

In 2013, the addition of the new frame institutions would have substantially increased graduate enrollment in multidisciplinary/interdisciplinary studies (11.5\%), computer sciences (11.1\%), communication (5.9\%), psychology (4.7\%), and health (4.3\%). (See figure 5 and table 3.)[7] Determining the eligibility of students and units in these fields is often challenging because of the professional orientation of many of these degree programs.

FIGURE 5. Percent distribution of graduate students in core and new frame institutions, by selected field: 2013

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.

Almost one-third (30.0\%) of graduate students enrolled at new frame institutions in 2013 were enrolled in computer sciences; however, more than half of these students (54.4\%) were enrolled in a single degree program at the University of Maryland, University College (UMUC) (table 3 and appendix table B-3). Consequently, this UMUC program, which offers online master's and doctorate degrees, more distinctly influences the GSS estimates than other new frame units.[8] Almost all (98.2\%) of the UMUC computer science graduate students were enrolled part time. Compared to students at other frame units and institutions, they were disproportionately U.S. citizens and permanent residents ( $98.6 \%$ versus $84.1 \%$ ) and black or African American (33.9\% versus 13.7\%). Overall, the inclusion of the new frame institutions in 2013 would have led to a 0.7 percentage point increase in the proportion of graduate students in computer sciences (table 3).

By contrast, only $5.0 \%$ of graduate students in new frame institutions were enrolled in engineering in 2013, compared to $24.2 \%$ of students in core institutions. Though the graduate students from new frame institutions in these five fields show larger-than-average increases, their effect on the overall change in these fields is minimal.

## Graduate Student Characteristics

Graduate students enrolled in new frame and core institutions in 2013 differed by enrollment status, demographic characteristics, and financial support. Larger proportions of graduate students in new frame institutions enrolled part time; were women; U.S. citizens or permanent residents; ethnic or racial minorities; and self-funded their graduate education (tables 4 and 5, figures 6 and 7).[9]

TABLE 4. Changes in the graduate student estimates due to adding new frame institutions, by enrollment, sex, citizenship, ethnicity, and race: 2013

Students and Postdoctorates in Science and Engineering, 2013.

## Enrollment Status

One of the largest differences between core and new frame institutions is enrollment status. Almost three-fourths (74.1\%) of graduate students at core institutions were enrolled full time in 2013 (table 4 and figure 6). By contrast, part-time enrollment (54.1\%) was more prevalent than full-time enrollment (45.9\%) among graduate students in new frame institutions in 2013. Among public new frame institutions, $71.0 \%$ of graduate students were enrolled part time (appendix table B-4), a much higher proportion of part-time graduate enrollment than for in all other institution control types (27.1\% in public core institutions, $38.4 \%$ in private nonprofit new frame institutions, $22.2 \%$ in private nonprofit core institutions, and $41.4 \%$ in for-profit core institutions).

Sex
In 2013, men were the majority (54.0\%) of the GSS-eligible graduate student population in core institutions, whereas women were the majority (53.8\%) in new frame institutions (table 4 and figure 6). The proportion of women among graduate students at public core, public new frame, and private nonprofit core institutions was similar ( $45.1 \%, 46.4 \%$, and $46.9 \%$ women, respectively; see appendix table B-4). The distribution of graduate students by sex was very different among private nonprofit new frame institutions and for-profit core institutions, with women constituting $60.7 \%$ and $73.3 \%$, respectively.

In contrast to the core institutions, where more women enrolled part time than men in 2013 ( $26.9 \%$ and $25.1 \%$, respectively), $58.2 \%$ of men attended new frame institutions part time as compared to $50.6 \%$ of women (table 4). Including new frame institutions will lead to a 0.2 percentage point increase in the proportion of female graduate students in the GSS.

## Citizenship

Foreign graduate students are much more prevalent at core institutions than at new frame institutions. In 2013 , only $13.6 \%$ of the graduate students at new frame institutions had temporary visas, as compared to $31.1 \%$ at core institutions (table 4 and figure 6). For-profit core institutions enrolled the highest percentages of U.S. citizens and permanent residents (98.6\%), followed by public new frame institutions (93.7\%), private nonprofit new frame institutions (79.7\%), public core institutions (69.8\%), and private nonprofit core institutions (65.2\%, see appendix table B-4).

At both core and new frame institutions in 2013 more foreign graduate students than their American peers were men and enrolled full time. However, foreign graduate students who are either female or enrolled part time are more common at new frame institutions (table 4). In 2013, 64.0\% of graduate students on temporary visas at core institutions were men; of these foreign male students $88.9 \%$ were enrolled full time. At new frame institutions, these percentages were $57.7 \%$ and $75.0 \%$, respectively. Unlike their American peers at new frame institutions, a higher proportion of male than female temporary visa holders enrolled full time; 77.9\% of male temporary visa holders at new frame institutions enrolled full time as compared to $70.9 \%$ of female temporary visa holders, $46.8 \%$ of female U.S. citizens and permanent residents, and $34.5 \%$ of male U.S. citizens and permanent residents enrolled full time.

As with core institutions in 2013, smaller proportions of women than men attending frame institutions were temporary visa holders ( $10.6 \%$ versus $16.9 \%$, respectively). Including new frame institutions in the 2013 data increases the number of U.S. citizens and permanent residents in the GSS data collection by
about $4.1 \%$ and results in a 0.6 percentage point decline in the overall proportion of temporary visa holders.

## Race and Ethnicity

As compared to graduate students at core institutions, a much higher percentage of students at new frame institutions are underrepresented minorities (table 4 and figure 7). Among U.S. citizens and permanent residents enrolled in SEH graduate programs in 2013, the majority (64.5\%) of graduate students at core institutions were white, $8.5 \%$ were black or African American, and $8.5 \%$ were Hispanic or Latino. In contrast, less than half (48.4\%) of the graduate students at new frame institutions in 2013 were white, $19.7 \%$ were black or African American, and $13.2 \%$ were Hispanic or Latino. Proportionally, new frame institutions enrolled almost twice as many underrepresented minority graduate students than core institutions ( $33.8 \%$ versus $17.8 \%$, table 4).[10]

At both core and new frame institutions, fewer U.S. citizens and permanent residents from underrepresented minority groups enrolled in SEH graduate programs full time compared to their white peers (table 4). Aggregating across minority groups, $39.0 \%$ of underrepresented minorities were enrolled full time at new frame institutions in 2013 as compared to $43.7 \%$ of whites at new frame institutions, and to $61.7 \%$ of underrepresented minorities and $69.0 \%$ of whites at core institutions. Within each racial and ethnic group, larger proportions of women enrolled in new frame institutions attended full time (6.7 percentage points to 25.7 percentage points).

Graduate enrollment by race and ethnicity varies substantially by type of institutional control (appendix table B-4). Slightly more than 4 of 10 (40.2\%) U.S. citizens or permanent residents enrolled in SEH graduate programs at for-profit core institutions were black or African American; at public new frame institutions, $26.9 \%$ were black or African American. These proportions far exceeded those seen at public core; private nonprofit core; and private nonprofit new frame institutions ( $7.8 \%, 7.9 \%$, and $11.8 \%$, respectively). By contrast, Hispanics or Latinos were disproportionately enrolled at private nonprofit new frame institutions (18.7\%), Asians at private nonprofit core institutions (10.9\%), and whites at public core institutions (67.2\%).

Including the new frame institutions would lead to a $6.3 \%$ increase in the number of Hispanic or Latino graduate students and a $9.5 \%$ increase in the number of black or African American graduate students in the GSS (table 4). Compared to men at new frame institutions, more female students attending these institutions were Hispanic or Latino (12.1\% versus $14.0 \%$, respectively) and similar proportions were black or African American (19.9\% compared to 19.4\%). These data would represent a 0.2 percentage point increase in the proportion of Hispanic or Latino graduate students, a 0.4 percentage point increase in the proportion of black or African American graduate students, a 0.6 percentage point decline in the proportion of white graduate students, and a 0.1 percentage point decline in the proportion of Asian graduate students in the 2013 GSS data.

## Graduate Student Financial Support

Full-time students in new frame institutions funded their graduate education differently than full-time students in core institutions in 2013. More than three-fourths (77.6\%) of full-time new frame institution graduate students were primarily self-supported, compared to only $37.7 \%$ of full-time graduate students in core institutions (table 5). Self-support among full-time graduate students was more prevalent at private nonprofit new frame institutions (83.3\%) than public new frame institutions (64.6\%), though the
greatest proportion of primarily self-supported graduate students was seen at for-profit core institutions (96.4\%, appendix table B-4).

Four times as many full-time graduate students at core institutions than those at new frame institutions were supported primarily by federal funds ( $16.4 \%$ versus $4.3 \%$ ). Of those receiving federal support, twice as many graduate students at core institutions had research assistantships compared to those at new frame institutions ( $72.3 \%$ versus $31.1 \%$, respectively; see table 5 ). The primary source of support for graduate students at core institutions in 2013 was institutional funding (40.4\%), just under half (45.7\%) of these students were supported through teaching assistantships. Among new frame institutions, only $22.3 \%$ of the $16.5 \%$ of graduate students receiving institutional funding as primary support had teaching assistantships. At both new frame and core institutions, larger percentages of women were self-supported ( $81.0 \%$ of new frame, and $41.2 \%$ of core) than men ( $72.9 \%$ of new frame, and $34.8 \%$ of core).

Less is known about the funding mechanisms for full-time graduate students in new frame institutions. Almost half (43.8\%) of full-time graduate students at new frame institutions were funded primarily through institutional funding mechanisms other than the traditional research assistantships, teaching assistantships, fellowships, and traineeships. By comparison, only $13.0 \%$ of full-time students attending core institutions were funded through these other mechanisms. Including the new frame institutions in the 2013 GSS would have led to a $4.2 \%$ increase in the number of full-time students who relied primarily on self-support and a 0.8 percentage point change in the proportion of self-supported graduate students.

## Postdocs and Nonfaculty Researchers

The impact of incorporating new frame institutions in the 2013 GSS is much less in the data for postdocs and NFRs than for graduate students. Forty-two units in 15 new frame institutions employed a total of 1,048 postdocs, and 34 units in 14 new frame institutions employed 343 NFRs (tables 2 and 6). Adding new frame institution postdocs would result in a $1.7 \%$ increase in the total number of postdocs and a $1.5 \%$ increase in the number of NFRs (table 6).

Postdocs at new frame institutions were clustered in the biological sciences. Three-quarters (75.5\%) of postdocs at new frame institutions (compared to $31.2 \%$ at core institutions) were in the biological sciences (table 6). Adding new frame institution postdocs to the 2013 GSS would lead to a $4.1 \%$ increase and a 0.7 percentage point increase in the proportion of postdocs in the biological sciences. Similar to the graduate student enrollment data, substantially fewer new frame postdocs were employed within engineering and health sciences units. Whereas $11.5 \%$ of core institution postdocs were in engineering fields and $29.9 \%$ were in the health sciences fields, only $2.2 \%$ of postdocs at new frame institutions were in these two fields combined.

Among postdocs at new frame institutions who were U.S. citizens and residents, $25.2 \%$ were Asian and $8.5 \%$ were Hispanic, higher than the $18.4 \%$ and $5.0 \%$, respectively, of postdocs working at core institutions. Adding the new frame institutions will result in a $2.2 \%$ increase in Hispanic postdocs. In 2013, a larger percentage of new frame institution postdocs were on temporary visas (62.9\%) than the postdocs at core institutions (52.3\%), which will lead to a $2.0 \%$ increase in postdocs on temporary visas.

TABLE 6. Changes in the postdoc and NFR estimates due to adding new frame institutions, by sex, citizenship, race, ethnicity, institutional control, and selected fields: 2013

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.

Primary sources of funding for postdocs in new frame and core institutions are also different. Approximately one-third (36.0\%) of postdocs at new frame institutions primarily received other nonfederal funding, a much larger percentage than the $16.9 \%$ of core institution postdocs (table 6 ). Smaller percentages of postdocs at new frame institutions received institutional support than did postdocs at core institutions (9.5\% versus 19.8\%). Most postdocs in new frame institutions were at private nonprofit institutions (96.4\%), compared to $45.3 \%$ of postdocs at core institutions.

As with postdocs, NFRs at new frame institutions were clustered in the biological sciences and few were in engineering or health units. Adding the new frame institutions would increase the total number of NFRs in the biological sciences by $4.3 \%$, leading to a 0.8 percentage point increase in the proportion of NFRs in the biological sciences (table 6). The proportion of NFRs in engineering and health would decline by 0.1 and 0.4 percentage points, respectively, because only $3.8 \%$ of NFRs at new frame institutions worked in engineering and $2.3 \%$ in health sciences (compared to $11.1 \%$ and $26.9 \%$ of NFRs at core institutions). Finally, $91.5 \%$ of NFRs in new frame institutions were at private nonprofit institutions, compared to $38.2 \%$ of NFRs in core institutions.

## ImPact of Removing For-Profit Institutions

The second change to the GSS frame beginning with the 2014 data release will be the exclusion of graduate students in for-profit institutions. As with the prior analysis of new frame institutions, the impacts of this change on future GSS data are examined by using the 2013 GSS estimates, with a trend analysis that includes data from 1996 to 2013. The for-profit core institutions differ from the public and private nonprofit core institutions in terms of the types of graduate degree programs offered and student composition.

The 2011 GSS screening survey of new potentially eligible institutions identified 18 for-profit institutions. At the end of the 2013 survey cycle, 12 new for-profit institutions remained as eligible. In 2013, the GSS core institutions included two for-profit institutions-Walden University and Alliant International University. Walden University was added to the GSS in 1996 with three units (preventive medicine and community health; clinical psychology; psychology, except clinical) reporting 332 graduate students. Alliant International University was added in 2002, also with three psychology graduate degree programs (clinical psychology, organizational psychology, and forensic psychology) reporting 1,282 graduate students (figure 8). By 2013, Walden University enrolled 8,884 graduate students in eight degree programs and Alliant International University enrolled 735 graduate students in four degree programs; together these students represented $1.5 \%$ of all graduate students in the GSS (tables 7 and 8).

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.

The GSS has been working with institutions over the past decade to identify and exclude practitioneroriented graduate programs. At the end of the 2013 data collection, the 47 units in the 12 newly identified for-profit institutions were evaluated because of continuing concerns about the eligibility of these units. The information provided by all for-profit institutions (including Walden University and Alliant International University), their program Web sites, and institutional mission statements were thoroughly reviewed. At the end of the review, it was determined that the primary mission and purpose of the 12 newly identified for-profit institutions and two extant for-profit institutions is to prepare students for professional careers. Thus, the graduate degrees offered are not research-oriented but rather practitioner-based programs, and are ineligible for the GSS.[11] For-profit institutions have also been excluded from the NCSES Higher Education Research and Development (HERD) survey frame because they have minimal research and development activities.[12]

Slightly more than $9 \%$ of all psychology students in the GSS were enrolled in for-profit institutions, and half (51.5\%) of graduate students in for-profit institutions were enrolled in a psychology program. The impact of excluding for-profit institutions will lead to a $0.7 \%$ decrease in the proportion of graduate students in the psychology (table 8).

Though the overall impact on GSS trend data of removing the two for-profit institutions is minimal (figure 9), graduate student demographics, enrollment status, and funding characteristics differ across for-profit and nonprofit institutions. For-profit institutions enroll higher percentages of female, U.S. citizen and permanent resident, and black graduate students than the core institutions (table 8). In 2013, almost three-fourths (73.3\%) of the graduate students enrolled at for-profit institutions were women, compared to $45.6 \%$ of students in nonprofit institutions. Overall, removing the two for-profit institutions will lead to a $2.4 \%$ decline in the number of female graduate students and $0.4 \%$ decrease in the proportion of women in the GSS. Almost all (98.6\%) of graduate students attending for-profit institutions were U.S. citizens or permanent residents, compared to $68.5 \%$ of graduate students in

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Surv ey of
Graduate Students and Postdoctorates in Science and Engineering.
nonprofit institutions. While 10.3\% of black or African American graduate students in the 2013 GSS attended for-profit institutions, 40.2\% of graduate students enrolled in for-profit institutions were black or African American.

Larger percentages of graduate students in for-profit institutions enrolled part time and were self-funded. In the 2013 GSS, $41.4 \%$ of graduate students at for-profit institutions attended part time, compared to $25.7 \%$ of students attending nonprofit institutions (table 8). Among full-time graduate students enrolled at for-profit institutions, $96.4 \%$ were primarily on self-support to pay for their graduate education. In contrast, only $37.0 \%$ of full-time graduate students enrolled in nonprofit institutions were on selfsupport.

## CONCLUSION

The changes to the frame-adding the new frame institutions, and excluding previously eligible forprofit institutions-will lead to small overall changes in GSS estimates, though some estimates will be disproportionately affected. The 2013 GSS population would have been approximately 644,000 graduate students after incorporating the new frame institutions, compared to the approximately 633,000 graduate students in the extant frame (table 9). The changes would lead to a $1.8 \%$ increase in overall graduate enrollment in SEH programs, a $0.8 \%$ increase in full-time students, and a $4.4 \%$ increase in part-time students. The increase in part-time graduate students would result in a $0.7 \%$ increase in the proportion of part-time graduate enrollment in GSS.

Compared to students at core institutions, larger proportions of students at new frame institutions are enrolled part time; are women or underrepresented minorities; and self-fund their graduate education. In addition, larger proportions of students at new frame institutions enrolled in computer science and multidisciplinary/interdisciplinary studies than those at core institutions; a smaller proportion of students in new frame institutions enrolled in engineering.

Larger proportions of graduate students in the for-profit institutions were black or African American, women, U.S. citizens or permanent residents, and studying psychology. The inclusion of the new frame institutions and the removal of the for-profit institutions will lead to small overall changes in the number or proportion of black or African American and female students. Specifically, there will be a net decline in the number (-279) and proportion ( 0.2 percentage points) of black or African American graduate students. Overall, these changes will also lead to a net decrease in graduate students in psychology, combined ( $-3,165$ ); preventative medicine and community health (-707); clinical psychology (-438); and political science and public administration (-222) and to an increase in graduate students studying computer sciences $(6,012)$; psychology, except clinical $(1,208)$; and multidisciplinary and interdisciplinary studies (675) (table 10).

Impacts of the frame change on postdoc or NFR data are minimal because the new frame institutions employed much smaller numbers of postdocs and NFRs than the core institutions.

Including new frame institutions and excluding previously eligible for-profit institutions will lead to changes in the GSS trend data. However, these changes will improve the survey coverage of the eligible graduate students and better highlight the evolving landscape of U.S. postsecondary institutions offering research-based SEH graduate programs.

nec $=$ not elsewhere classified.
${ }^{\text {a }}$ Percentage point (PP) change is the percent distribution of all institutions minus the percent distribution of core institutions. The PP change (rather than the percent change) describes the impact of adding the new frame institutions on the current distribution.

NOTES: This table only includes the fields that are impacted by adding units from new frame institutions and removing units from private, for-profit institutions. Thus, not all numbers and percentages sum to total.

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.

## KEy Terms

Core-An institution which was eligible for the GSS and included in the survey in 2013.
Doctorate-holding nonfaculty researcher (NFR)—Employees who meet both of the following qualifications: not considered either postdoctoral researchers or members of the faculty and involved principally in science, engineering and health research activities.

Fields-The discipline of a unit according to the GSS taxonomy.
GSS-eligible fields-Science, engineering, and health fields included in the GSS taxonomy.
GSS-eligible institutions-All academic institutions in the United States and its territories that grant research-oriented master's degrees or doctorates, appoint postdocs, or employ NFRs in S\&E and healthrelated fields.

GSS-eligible units-Academic units in an eligible institution in an eligible field that meet GSS codespecific criteria for inclusion.

New frame institutions—Newly eligible institutions identified through the 2008 or 2011 frame evaluations and annual frame evaluations since 2011.

Postdoctoral researcher (postdoc)—NSF defines a postdoc as meeting both of the following qualifications: holds a recent doctoral degree (generally awarded within the last 5-7 years); has a limited-term appointment (generally no more than 5-7 years); primarily training in research or scholarship; and working under the supervision of a senior scholar. The definition of a postdoc varies by institution; institutions use their own definition of a postdoc when reporting.

School-A set of units for which a coordinator can provide data; this is typically a graduate school, medical school, nursing school, school of public health, or a branch campus. Schools are not discussed in this report.

Unit-For reporting purposes, units typically correspond to academic departments, programs, research centers, or health care facilities within the same GSS field.

## Notes

1 See "New institution eligibility screening for the Survey of Graduate Students and Postdoctorates in Science and Engineering: Methodology Report." For more information please contact the GSS Project Officer: Kelly H. Kang, Human Resources Statistics Program, National Center for Science and Engineering Statistics, National Science Foundation, 4201 Wilson Boulevard, Suite 965, Arlington, VA 22230 (kkang@nsf.gov; 703-292-7796).

2 Subsequent to this analysis, a total of 154 potentially eligible institutions were added to the data collection in 2014. These included the 140 institutions identified during the 2011 review that remained eligible at the end of the 2013 data collection and 14 additional institutions identified by the new annual frame coverage review. By the end of the 2014 data collection, two of these new institutions had been classified as ineligible and one had merged with an extant institution in 2013. As a result, the final 2014 GSS included 151 new institutions (see appendix A for more information about the GSS frame reviews).

3 See "New institution eligibility screening for the Survey of Graduate Students and Postdoctorates in Science and Engineering: Methodology Report."

4 These institutions are hereafter referred to as for-profit institutions.
5 Percentage point ( $P P$ ) change is the percent distribution of all institutions minus the percent distribution of core institutions. The PP change (rather than the percent change) describes the consequences of adding the new frame institutions in the GSS trend data. For example, part-time graduate students represented $25.9 \%$ of the graduate students in the core institutions and $26.8 \%$ in the core plus new frame institutions. Thus, adding the new frame institutions will result in a 0.9 PP increase in part-time graduate enrollment in 2013.

6 In 2013, Rowan University (a new frame institution) acquired the New Jersey School of Osteopathic Medicine previously of the University of Medicine and Dentistry of New Jersey. In doing so, Rowan University became a mix of new frame and core institution. For this analysis, Rowan University is considered a new frame institution, but the students enrolled in the New Jersey School of Osteopathic Medicine are considered part of the core institution. Thus some numbers in this report will not match published figures for the 2013 and 2014 GSS, where Rowan was counted as a core institution.

7 Appendix tables B-1 and B-2 present detailed estimates of graduate enrollment in computer sciences and multidisciplinary and interdisciplinary studies, respectively.

8 For details on the UMUC online master's and doctoral degrees, see http://www.umuc.edu/academic-programs/masters-degrees/index.cfm.

9 More detailed information is available in appendix tables B-4 and B-5. Appendix table B-4 divides the students in core and new frame institutions by the public and private status and nonprofit status of the institutions. Appendix table B-5 examines the student characteristics based on enrollment in core and new frame institutions; appendix tables B-5 and B-6 include estimates of the percentage of each type of student enrolled in new frame institutions, the percentage of core and new frame institution students, and the percentage and percentage point change in the overall estimates as a result of adding new frame institutions.

10 Underrepresented minorities include blacks, Hispanics, American Indians or Alaska Natives, and Native Hawaiians or Other Pacific Islanders.

## Appendix A: Summary of GSS Frame Evaluations

As a part of the 2006 GSS survey redesign, the methodological research was conducted to examine the coverage of GSS-eligible institutions. The research identified 605 institutions that were not included in the 2006 survey frame but could be eligible. The vast majority of the potentially eligible institutions (537) were identified based on their reporting of the master's or doctoral degree awards using at least one GSS-eligible Classification of Instructional Programs (CIP) code to the 2006 Integrated Postsecondary Education Data System (IPEDS) Completions Survey.[1]

The evaluation began in 2008 with the screening of 80 of the potentially eligible institutions. In this study, 32 of the 80 had masters programs in science, engineering, and health. Follow-up screening over the next two cycles determined that 19 of these institutions had only practitioner-focused programs, making them ineligible and leaving 13 eligible institutions.

A comprehensive review began in 2010 with a review of 2009 IPEDS Completions survey data and other sources. This yielded 529 institutions, which were further investigated using two additional measures: an institution Web site review and a GSS Eligibility Screening Survey. The graduate degree program information on the Web sites for potentially eligible new institutions were reviewed to determine the types of degrees offered, research or thesis requirements for the degree, and whether the degree program was primarily to prepare the students for professional licensure. Two reviewers independently assessed the eligibility of each degree programs and noted any special circumstances, such as discontinuation of program(s).

The GSS Eligibility Screening Survey was administered to these institutions in spring 2011. The survey, primarily conducted via the Web, was designed to collect more information about potentially eligible degree programs offered at the institutions. For disciplinary fields that had degree exclusions (e.g., "excludes PsyD" for GSS code 803), the survey confirmed whether the institution only offered the excluded degree type. For fields where practitioner-oriented degrees are common, the survey asked special questions about the research and management orientation of the program.[2]

The frame evaluation process resulted in 159 newly eligible institutions that were surveyed for the first time in the 2011 GSS. The total number of newly eligible institutions was 165 at the end of the 2011 cycle-152 of the 159 institutions identified in the frame evaluation process remained as eligible and all 13 institutions identified from the 2008 New Institution Pilot Study.

The intention was to include the data from these new frame institutions in the 2011 GSS data release, but after an initial assessment of the data reported by the new frame institutions, NCSES determined that more years of data were needed to conclusively verify the degree program eligibility and to work with the new institutions to improve their data reporting. During the 2012 and 2013 survey cycles, 25 additional institutions were determined as ineligible as more data became available about their degree programs, resulting in 140 newly eligible institutions for the 2014 GSS. A frame review conducted as part of the 2014 GSS resulted in an additional 14 institutions added to the new frame. Ultimately, 151 institutions were added in 2014, reflecting the 140 institutions discussed here, the 14 institutions identified in 2014 (with one merger and two other institutions becoming ineligible in 2014). As discussed in this report, though the number of eligible new frame institutions in 2013 was substantial (140) relative to the number of core institutions (563), the new frame institutions had substantially fewer units and GSS-eligible graduate students than their counterparts in the core institution. (See figure 4.)

The data collected from the newly eligible institutions will be incorporated into the published GSS data starting in 2014. For more information please contact the GSS Project Officer.

- = no value possible.
nec $=$ not elsewhere classified .
${ }^{\text {a }}$ Percentage point (PP) change is the percent distribution of all institutions minus the percent distribution of core institutions. The PP change (rather than the percent change) describes the impact of adding the new frame institutions on the current distribution.
${ }^{\mathrm{b}}$ Ethnicity and race data are available only for U.S. citizens and permanent residents.
${ }^{\text {c }}$ Financial support data are available only for full-time students.
${ }^{\mathrm{d}}$ Excludes primarily self-supported graduate students.
${ }^{e}$ Data collection field only; included within detailed field above in the published data.
SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, Survey of Graduate Students and Postdoctorates in Science and Engineering, 2013.
