# Higher Education R\&D Spending: Spending and Funding Sources Differ by State 

by Katherine Hale, Ronda Britt, and Michael Gibbons ${ }^{1}$

Universities and colleges play an important role in conducting research and development in the United States. Academic institutions spent $\$ 72$ billion on R\&D in 2016, an increase of $21 \%$ over the past decade, after adjusting for inflation. Data in this InfoBrief are from the Higher Education R\&D Survey, from the National Center for Science and Engineering Statistics within the National Science Foundation.

Academic institutions focus on a variety of different fields as they conduct R\&D and rely on various funding sources. This InfoBrief presents information on funding sources for academic R\&D at the state level. It focuses on total academic R\&D spending, by state in 2016, for the 640 institutions that spent at least $\$ 1$ million on $R \& D$ in the previous reporting year (2015). Together, these institutions accounted for $99.8 \%$ of the total higher education R\&D expenditures reported for 2016. Data are provided on the 50 U.S. states and the District of Columbia, with an emphasis on the 6 states with the largest academic R\&D expenditures. Spending trends are analyzed by funding source from 2010 to 2016 and, where data are available more broadly, from 2007 to 2016.

## Higher Education R\&D Funding State Overview

Six states accounted for just under $45 \%$ of the total academic R\&D spending in 2016: California, Maryland, Massachusetts, New York, Pennsylvania, and Texas. Universities in each of these states spent $5 \%$ or more of the $\$ 72$ billion total. An additional six states accounted for another 20\%: North Carolina, Florida, Michigan, Illinois, Ohio, and Georgia. In each of these states, universities conducted between $3 \%$ and $4 \%$ of the 2016 total. By contrast, the remaining 38 states plus the District of Columbia accounted for only $35 \%$ of total academic R\&D expenditures in 2016.

Academic R\&D spending trends from 2007 to 2016 varied considerably across states. In 21 states and the District of Columbia, inflation-adjusted spending increased by more than the overall average increase of $21 \%$. In ten states, spending decreased, although in each case the decrease was from a relatively small base. In general, states with high academic R\&D expenditures did not experience declines over the past decade (table 1).

Universities rely to differing degrees on the various major sources of funding, including the federal government, state and local governments, businesses, nonprofit organizations, and higher education institutions (table 2). The federal government, for example, funded 54\% of total academic R\&D in 2016, but it contributed more than 70\% in three states: Colorado, Maryland, and Vermont. Similarly, higher education institutions funded $25 \%$ of total academic R\&D in 2016, ranging from less than $10 \%$ in Colorado to more than $45 \%$ in Rhode Island. Many differences by state also exist for the three other major funding sources. For example, among the six states with the highest levels of academic R\&D spending, universities in Texas relied less on federal funding and more on state and local funds, compared with the national averages, whereas New York and Massachusetts schools relied more on funding from businesses.

## R\&D Fields

Life sciences was the science and engineering (S\&E) field that accounted for the bulk of academic $\mathrm{R} \& D$ spending: $\$ 41$ billion in 2016 , or $57 \%$ of the total. Other S\&E fields, in declining order of

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, special tabulations (2018), Higher Education Research and Development Survey, FY 2016.
expenditures, were engineering ( $16 \%$ ), physical sciences ( $7 \%$ ), geosciences (4\%), social sciences ( $3 \%$ ), computer sciences ( $3 \%$ ), psychology ( $2 \%$ ), and mathematical sciences (1\%). Non-S\&E fields constituted $6 \%$ of total spending. In addition, just under $2 \%$ of academic R\&D spending was allocated toward sciences that include multidisciplinary or interdisciplinary work that could not be classified within a broad field. ${ }^{2}$

Higher education R\&D spending within states differs somewhat by field. Universities in California, New York, Pennsylvania, and Texas performed a higher proportion of R\&D in life sciences $(60 \%-65 \%$ in 2016) than the national average ( $57 \%$ ), whereas those in Maryland and Massachusetts performed a lower proportion of their R\&D in life sciences ( $44 \%$ and $41 \%$, respectively). Schools in Maryland and Massachusetts performed a higher proportion of R\&D in engineering ( $31 \%$ and $21 \%$, respectively) than the national average ( $16 \%$ ), whereas those in California, New York, and Pennsylvania performed a lower proportion of their R\&D in engineering fields ( $12 \%-14 \%$ ). The proportions spent on the other broad fields in the top six states were similar to the national average proportions for these fields.

## Federal Funding

The federal government funded \$39 billion (54\%) of academic R\&D in 2016, up from $\$ 31$ billion in $2007 .{ }^{3}$ In 2016, as in prior years, private universities relied more on federal funding than did their public counterparts ( $60 \%$ versus $51 \%$ of their total $R \& D$ in 2016). Over the past decade, federal funding increased by $8 \%$ after adjusting for inflation; since 2010, however, federal funding declined by $6 \%{ }^{4}$

The American Recovery and Reinvestment Act of 2009 (ARRA) funded over $\$ 9$ billion of academic R\&D during the recession and recovery from 2010
to 2012 and continued to contribute, although in smaller amounts, in 2013 and 2014. By 2015, all ARRA funds had been spent. ${ }^{5}$

Federal funding has played a larger role in overall support for some fields than for others. In 2016, the federal government provided the majority of funding in life and physical sciences, engineering, computer sciences, geosciences, mathematics, and psychology. ${ }^{6}$ By contrast, the federal government played a smaller role in social sciences and non-S\&E fields, funding only one-third or less of the academic R\&D performed. ${ }^{7}$ Among the six states with the highest levels of academic R\&D spending, universities in California and Massachusetts spent a relatively large share of federal funds on the physical sciences, compared with the national average; in Maryland, a relatively large share of federal funds was spent on engineering; in New York, life sciences; and in Pennsylvania, computer and information sciences. In Texas, the field distribution of federal funding of higher education R\&D largely mirrored the overall national pattern.

Federal funding of states' higher education R\&D ranged from about $35 \%$ in North Dakota and Arkansas to more than 70\% in Colorado, Maryland, and Vermont (figure 1). In 31 states, federal funding contributed over $50 \%$ to their total academic R\&D spending. Texas, which ranked third among all states in total spending, ranked third from the bottom in the percent to which the federal government contributed to this spending (39\%), above only Arkansas and North Dakota. As a group, however, $45 \%$ of total federal spending in 2016 was concentrated in the top six states, identical to the concentration of overall spending.

## Institutions' Own Funding

Institutional funds play a prominent role in academic R\&D spending. ${ }^{8}$ At
$\$ 18$ billion and $25 \%$ of total expenditures in 2016, funds provided by institutions themselves provide the second largest source of R\&D spending for universities and colleges. Such funding is especially important at public universities, where it accounted for $27 \%$ of total spending in 2016 compared to $21 \%$ at private universities. Among the major funding sources for academic R\&D, institutional funding saw the largest increase (37\%) from 2010 to 2016, after adjusting for inflation.

Universities differ by state in the extent to which they rely on their own institutions' funds for academic R\&D, ranging from $9 \%$ in Colorado to $46 \%$ in Rhode Island (figure 2). In three of the top six states-California, New York, and Texas-inflation-adjusted increases in institutional funding of roughly $40 \%$ from 2010 to 2016 broadly matched the overall increase in the United States. From 2010 to 2016, institutional funding doubled in Pennsylvania and tripled in Massachusetts, after adjusting for inflation, but it increased by only $13 \%$ in Maryland. In Pennsylvania, Texas, and New York, institutional spending constituted about $25 \%$ of these states' total academic R\&D; in Massachusetts and California, on the other hand, institutional funding was a somewhat smaller share of total academic R\&D (around 20\%), and in Maryland, institutional funding constituted only $12 \%$ of the state's total spending on higher education R\&D.

As with total academic R\&D spending, institutional funding largely supports the broad fields of life sciences (54\%) and engineering ( $13 \%$ ). However, the non-S\&E fields also feature prominently in universities' own funding of R\&D (12\%). These fields include education, business management, and law, among others. Among the top six states, however, institutional funding patterns vary from the national trend: universities in California and New

York spent relatively large shares of institutional funds on life sciences; in Maryland, geosciences; and in Massachusetts and Pennsylvania, non-S\&E fields. Institutional funds in Texas schools followed a similar pattern as the United States, with $56 \%$ spent on life sciences and $16 \%$ on engineering.

## Nonprofit Funding

Nonprofit organizations provided $\$ 4.6$ billion (6.4\%) of academic R\&D funding in 2016. The proportion of funding provided by nonprofit organizations was slightly higher at private institutions (8\%) than at public institutions ( $6 \%$ ). ${ }^{9}$ After adjusting for inflation, overall funding by nonprofit organizations increased from 2010 to 2016 within 31 states and nationally by $12 \%$. Among the top six states, nonprofit funding increases varied widely, from 5\% in California to $35 \%$ in Massachusetts. As a share of a state's total higher education R\&D spending, nonprofit funding ranged from $1 \%$ in Arkansas to $10 \%$ in the District of Columbia (figure 3).

For the top six states, nonprofit funds as a percentage of total higher education $R \& D$ expenditures ranged from $5 \%$ in Maryland to just under $10 \%$ in California.

Nonprofit funds are used largely for life sciences (66\%). Among the top six states, universities in California, Maryland, New York, Pennsylvania, and Texas all spent large shares (65\% to $89 \%$ ) of the funds provided by nonprofit organizations on R\&D in life sciences. The situation was different in Massachusetts, which used nonprofit funding more evenly across the various S\&E and non-S\&E fields. Although the largest share went to the life sciences (38\%), relatively large shares went to non-S\&E fields (16\%) and the social sciences (14\%).

## Business Funding

Businesses provided $\$ 4.2$ billion for higher education R\&D in 2016 (6\% of total spending). As a percentage of total funding, business sources ranged
from $1.7 \%$ in Nevada to $12.1 \%$ in North Carolina (figure 4). Private universities relied somewhat more on R\&D funding from businesses than their public counterparts did (7\% versus 5\%). ${ }^{9}$ After adjusting for inflation, R\&D funds from business sources increased by $19 \%$ from 2010 to 2016, with 34 states experiencing an increase. Business funds increased at universities in five of the top six states but declined by $3 \%$ in Maryland. Among the other top six states, increases ranged from $5 \%$ in California to $58 \%$ in New York.

In 2016, the percentage of total business funding devoted to life sciences was slightly larger ( $61 \%$ ) than the percentage across all sources of funding (57\%). Businesses also placed a greater emphasis on engineering, with engineering receiving $25 \%$ of total business funds in 2016 (but only $16 \%$ of total academic R\&D expenditures). R\&D funds from businesses increased most from 2010 to 2016 in non-S\&E fields.

Among the top six states, Massachusetts and New York spent relatively large shares of R\&D funds provided by businesses on engineering ( $33 \%$ and $44 \%$, respectively); schools in Massachusetts also spent a relatively large share of business funds on non-S\&E fields (16\%). ${ }^{10}$ Schools in California, Pennsylvania, and Maryland spent the majority of funds provided by businesses on life sciences R\&D (62\%, $76 \%$, and $85 \%$, respectively).

## State and Local Government Funding

Funds from state and local governments totaled just over $\$ 4$ billion in 2016 and constituted $6 \%$ of total higher education R\&D spending that year. ${ }^{11}$ As a percentage of total funding, state and local government funding ranged from $1 \%$ in Vermont to $27 \%$ in North Dakota (figure 5). Public institutions derived more of their R\&D funds from state and local governments than did private
institutions ( $8 \%$ versus $1 \%$ of their total $R \& D$ in 2016).

State and local government funds for higher education R\&D declined 6\% from 2010 to 2016, after adjusting for inflation. There were wide variations among the states. Such funding declined by varying amounts in 31 states, for example, falling by $2 \%$ in Florida and by $75 \%$ in Missouri.

Among the top six states, state and local government funding declined in California, Maryland, New York, and Pennsylvania ( $9 \%$ to $45 \%$ ), whereas it doubled in Massachusetts, largely as the result of an increase in state grants to equip several laboratories focused on R\&D in life sciences. State and local government funding for academic R\&D increased by $27 \%$ in Texas.

State and local funds have largely been used to support life sciences ( $61 \%$ )
and engineering (17\%) R\&D. Among the top six states, Maryland and New York spent relatively large shares of R\&D funds provided by state and local governments on engineering R\&D ( $25 \%$ and $41 \%$, respectively) and Pennsylvania spent a large share of such funds on life sciences R\&D (76\%).

## Data Sources and Limitations

Data are from the 2016 Higher Education R\&D Survey. The year referred to throughout this report is the academic fiscal year. For most institutions, FY 2016 represents 1 July 2015 through 30 June 2016. Expenditures are in current year dollars, but the report adjusts for inflation when comparing across more than one year. ${ }^{12}$ The amounts reported include all funds expended for activities specifically organized to produce research outcomes and sponsored by an outside organization or separately accounted for using institution funds.

SOURCE: National Science Foundation, National Center for Science and Engineering Statistics, special tabulations (2018), Higher Education Research and Development Survey, FY 2016. Map powered by Bing. © DSAT for MSFT, GeoNames, Navteq.

The national total includes approximately $\$ 3$ billion in pass-through funds that are double-counted because such funds are counted by the universities initially receiving the money and by the universities to which the funds are passed. R\&D expenditures at univer-sity-administered federally funded research and development centers are not included in this report.

Figures 1 to 5 present data by quartile. The quartiles were determined by dividing the 50 states plus the District of Columbia into quartiles, with the top quartile showing the $25 \%$ of states that reported the highest shares for the funding source presented, the second quartile presenting data for the $25 \%$ of states that reported the second-highest shares, and so forth.

For more data on the relationship of higher education R\&D state economies, see the National Science Board's Science and Engineering Indicators 2018 State Indicators. This site includes data on the ratio of R\&D expenditures at a state's
colleges and universities to the size of the state's economy (https://www.nsf. gov/statistics/state-indicators/indicator/ academic-rd-per-1000-state-gdp).

and Engineering Indicators 2018, NSB-2018-1. Alexandria, VA: National Science Foundation. Available at https:// www.nsf.gov/statistics/2018/nsb20181/.
7. See table 5-1 in National Science

Board (NSB). 2018. Academic Research and Development. In Science and Engineering Indicators 2018, NSB-2018-1. Alexandria, VA: National Science Foundation. Available at https://www.nsf.gov/ statistics/2018/nsb20181/.
8. Institutionally financed research includes organized research projects fully supported with internal funding and all other institutional funds for research that are separately accounted for. The ability to identify and report all such internal funding for research varies by institution, resulting in an undercount of this source of funding for some institutions. Institutional spending does not include funds spent on research that are not separately accounted for, such as estimates of faculty time budgeted for instruction that is spent on research. For
further detail on institutional spending for academic R\&D, see table 5-7 and table 5-8 in National Science Board (NSB). 2018. Academic research and development. In Science and Engineering Indicators 2018, NSB-2018-1. Alexandria, VA: National Science Foundation. Available at https://www.nsf.gov/ statistics/2018/nsb20181/.
9. See figure 5-4 in National Science Board (NSB). 2018. Academic Research and Development. In Science and Engineering Indicators 2018, NSB-2018-1. Alexandria, VA: National Science Foundation. Available at https://www.nsf.gov/ statistics/2018/nsb20181/.
10. National Science Foundation, National Center for Science and Engineering Statistics, special tabulations (2018) from WebCASPAR with FY 2016 data from the Higher Education R\&D Survey: https://ncsesdata.nsf.gov/ webcaspar/.
11. The share of state and local govern-
ment funding has declined from a peak of $10 \%$ in the early 1970 s to below $6 \%$ in recent years. However, actual amounts may be understated, particularly for public institutions, because they reflect only funds specifically targeted for R\&D, whereas general purpose funds may be designated by the recipient institutions for $\mathrm{R} \& \mathrm{D}$ or indirect cost recovery and may thus show up as institutional research support. See table 5-4 in National Science Board (NSB). 2018. Academic research and development. In Science and Engineering Indicators 2018, NSB-2018-1. Alexandria, VA: National Science Foundation. Available at https://www.nsf.gov/statistics/2018/ nsb20181/.
